

## Telekom Austria

Telekom Austria makes use of Observer Distributed Application Service (AS) of NETAVIS.

**Industry:**  
Telecommunications

**Location:**  
Headquarters Austria

**Applied modules:**  
Observer Distributed Application Service

**Technical data:**  
Highly available cluster of NETAVIS user and camera servers including integration of control station, applied by Telekom Austria

*„Innovative and highly efficient.“*

Gerhard Seltenhammer  
Head of Security, Telekom Austria

### The challenge

Telekom Austria Group is the largest telecommunications company in Austria and is successfully positioned on the international market. Therefore, high requirements are set when it comes to video surveillance.

On the one hand the professional video surveillance software should be applied for project business. On the other hand it should be able to be run as Application Service (AS) as well.

Further requirements set by Telekom Austria are the seamless scaling to thousands of cameras of several vendors as well as the possibility to run the software in a highly available data centre.

### The solution

The Distributed AS of NETAVIS has been adapted to the needs of Telekom Austria. Thus, the telecommunications company obtained a comprehensive package that combines the strengths of a professional, open and distributed video surveillance software with the possibility of applying the software as Application Service with multitenancy.

Beyond that, the software can be adapted individually by Telekom Austria.

### The benefits

The main benefit of NETAVIS Distributed AS is that customers of Telekom Austria use the advantages of the adapted video application Observer 3 that has been provided by Telekom Austria. This usage is secure and convenient for

customers, as they do not have to run the server by themselves. The customers log in to the NETAVIS server of Telekom Austria via internet through which they can access the software.

Additionally, NETAVIS Distributed AS distinguishes itself by offering a high level of flexibility. Thousands of cameras of several vendors can be run in only one system without any problems. Thanks to the innovative strength of NETAVIS, Telekom Austria is able to offer their customers the latest technology at all times, such as the video analytics toolbox iCAT which has been developed by NETAVIS.

Using a robust high availability cluster guarantees that the video surveillance solution will run 24/7 with NETAVIS Observer.

Furthermore NETAVIS possesses relevant experience out of 2000 successful installations in Europe and the Middle East, which makes NETAVIS a solid partner for Telekom Austria.
